

ChatGPT CODEX INDIA HACKATHON 2026

Themes, Problem Statements & Submission Guidelines

Build Phase Guidelines

- Participants must **choose one of the nine themes**, **pick or invent a project**, and **build a functional solution** during the challenge timeline.
- **Submission Deadline: 3rd August** Late entries will not be accepted.
- Projects must be **built primarily with OpenAI Codex**, demonstrating genuine agentic usage like planning and self-review.
- A **publicly accessible deployed link** is mandatory (e.g., Vercel, Render) and must not require credentials.
- A **Mentor Session** will be held on **25th** to provide guidance on Codex build strategies.
- Registered participants will receive an email with registration and joining details for the session.
- Participants **must follow the submission requirements** outlined below to be eligible for evaluation. **Submissions will be accepted only through the BlockseBlock platform** on which you registered for the hackathon.
- The use of AI tools, open-source libraries, and publicly available resources is permitted and encouraged. However, participants must **ensure that their submission reflects their own work, understanding, and implementation**.

Top Projects Examples:

Submission Requirements

Mandatory Items

To be eligible for evaluation, each participant must submit the following:

- **Deployed Application Link**: Must remain active and functional throughout evaluation.
- **GitHub Repository Link**: Public repo with visible commit history for originality checks.
- **Demo Video**: 3-minute max video showing end-to-end functionality and Codex usage.
- **Project Description (Google Doc)**: Documentation covering track, problem statement, and technical stack.

Please ensure that the **document is accessible to anyone with the link** and remains available throughout the evaluation period. Organisers may review the document and its version history as part of the evaluation process.

Viability Gate

Before scoring, every submission passes through a pass/fail viability check: the deployed link opens, the core flow runs, and the repository matches what was demoed. Submissions that fail this gate are not scored on the matrix below.

Evaluation Matrix

- All submissions will be evaluated based on the criteria specified in the evaluation matrix below.
- The organizers reserve the right to verify the originality, functionality, and eligibility of any submission and may request additional evidence if required.
- The jury's decision regarding shortlisting, rankings, and winner selection shall be final and binding.

Criteria	Weightage	What judges look for
Technical Execution	50%	Does it actually work? Code quality, architecture, and how much of it Codex genuinely built.
Impact & Problem Fit	20%	Is this a real problem, and does the solution meaningfully move the needle for its users?
Use of Codex	15%	Depth of agentic usage — beyond autocomplete. Planning, multi-step execution, review loops.
Creativity & Originality	10%	Novelty of the idea and of the approach. Does it surprise the judges?
Completeness & Demo Quality	5%	Is it usable end to end, and does the demo clearly show it working?

Themes & Problem Statements

Themes 1–5 are OpenAI's five official Codex build directions. Themes 6–9 are India-relevant bonus themes. Each track carries ten ranked project ideas in the accompanying "Themes & Project Ideas" document-you may pick one of those, remix them, or bring your own idea within the track.

1. Agentic Coding

The core of Codex - agents that write, refactor, test and ship code.

Example ideas: Auto-docs agents, commit & changelog agents, test-coverage agents, dependency-upgrade bots, framework migrations, security-review agents, multi-agent engineering teams, self-healing CI.

2. UX for Agentic Applications

The interface layer -how humans steer, review and trust agents.

Example ideas: Agent activity logs, one-click diff review, multi-agent supervisor dashboards, trust meters, IDE extensions that pause/fork a running agent, natural-language agent debuggers.

3. Multimodal Intelligence

Codex plus vision, audio and data.

Example ideas: Screenshot-to-code, voice-to-app, wireframe-to-deployed-app, whiteboard-photo to schema + CRUD API, architecture diagram to scaffolded microservices, video tutorial to runnable repo.

4. Domain Agents

Codex applied to a specific vertical's real workflow.

Example ideas: Fintech expense categorisers, legal clause explainers, healthcare intake agents, logistics route + ETA agents, tax-filing agents, continuous compliance auditors.

5. Building Evals

Reliability and measurement - increasingly emphasised at Codex events.

Example ideas: Agent test harnesses, prompt-regression trackers, red-team evals, hallucination detectors for code agents, long-horizon reliability benchmarks, cost/latency/quality dashboards.

6. AI Agents for Bharat's Businesses

BFSI, retail and MSME automation.

Example ideas: WhatsApp invoicing for kirana stores, GST reminder agents, inventory + reorder agents, bilingual D2C support, "MSME back-office in a box", UPI reconciliation across messy real-world data.

7. Vernacular / Indic Languages & Local Discovery

"Solve for India" -language, mobility and local discovery.

Example ideas: Code-comment translation, vernacular error explainers, voice-to-app in Hindi/Tamil/Bengali, civic query agents, government-service integration layers, Indic-language coding tutors.

8. AI for Societal Good

Healthcare, accessibility, disaster response and civic tech.

Example ideas: Accessibility agents (alt-text, ARIA, captions), disaster-info aggregators, clinic triage routing, municipal budget explainers, road-safety appraisal from dashcam or satellite imagery.

9. Vibe Coding / Games / Creative

Fun, weird and delightful - for non-traditional builders.

Example ideas: Browser mini-games built in an hour, meme-to-web-app generators, AI dungeon masters, generative music visualisers, games that rewrite their own rules at runtime.

Submission Steps

Step 1: Go to the **BlockseBlock Dashboard** — <https://blockseblock.com/dashboard> — where you will see the hackathon. Click on **"Create Project"**

Step 2: Enter your **unique Project Name** → **select the Track** you have chosen → click **"Save & Next"**

Step 3: Provide the **mandatory links** as per the submission requirements → click **"Submit Now"**

Step 4: **Toggle on both Notes** → click **"Continue"**

Step 5: Click on **"Final Submit"** (Note: please proceed with this step only when you are fully satisfied with your submission. Once completed, you will not be able to modify, edit, or resubmit your entry.)

Important — Step 5 is compulsory, otherwise your submission will remain in drafts.

To verify your submission

- Go to your Dashboard → click **"My Projects"**
- It should show **Submitted** against your project.
